

GPU proxy vs chip on four paired effects

Each point is one change measured on an L40S GPU with the virtual charged clock and on Trainium, seed 73, at equal steps.

Source: docs/SIMULATOR.md, route 2. Absolute level: one K60 run gave 0.959952 on the GPU and 0.959948 on chip at 2,314 steps; default-mode CUDA runs of one config differed by 0.00056 between boxes, so that 4e-6 match is partly luck. n = 4 is a small sample.
